Abstract: We obtain necessary and sufficient conditions for the existence of 2-rotational 6-cycle systems, and enumerate certain classes of 6-cycle systems of small orders with prescribed types of automorphisms.

1 2-rotational 6-cycle systems

A 6-cycle system of order n, denoted 6CS(n), is a pair (V, B) where V is an n-set and B is a collection of edge-disjoint cycles of length 6 such that each edge of the complete graph K_n on V is contained in exactly one of the 6-cycles of B. In other words, a 6-cycle system of order n is a decomposition of the complete graph K_n into 6-cycles.

There has been recently some interest in 6-cycle systems, mainly because of their connections to algebra and to Steiner triple systems. It is well known that a 6CS(n) exists if and only if $n \equiv 1$ or 9 (mod 12), see, e.g., [4].

It was shown recently [3] that 6-cycle systems are universal in the sense that every abstract group is the full automorphism group of a 6-cycle system. Therefore the next natural question is: Which permutations of degree n are automorphisms of a 6CS(n)?

^{*}Corresponding author.

A 6CS(n) is *cyclic* if it admits an automorphism permuting the vertices in a single cycle of length n. A 6CS(n) is *k*-rotational ($k \ge 1$) if it admits as an automorphism a permutation containing exactly one fixed point and k cycles of length $\frac{n-1}{k}$ each. Note that we are using the term "cycle" to describe both, a sequence in a graph (or a graph itself) as well as a part of a permutation; no confusion should arise by this, however.

It was shown in [5], [6] that a cyclic 6CS(n) exists if and only if $n \equiv 1$ or 9 (mod 12), $n \geq 13$.

In [1], it was shown that there exists no 1-rotational 6CS(n) for any n. It is not difficult to show that, in fact, a k-rotational 6CS(n) cannot exist for any odd k.

The main purpose of this note is to settle the existence question for 2rotational 6CS(n), i.e. those that admit an automorphism having exactly one fixed point and two cycles of length $\frac{n-1}{2}$ each. In [7] which deals more generally with k-cycle systems with an even k, it was established that there exists a 2-rotational 6CS(9), and the same can be gleaned also from [2].

Theorem 1.1. A 2-rotational 6CS(n) exists if an only if $n \equiv 1$ or 9 (mod 12), $n \geq 9$.

Proof. Our proof is by direct construction. In what follows we use standard notation x_i to denote (x, i).

I. Let $n \equiv 1 \pmod{12}$, n = 12k+1. The set of elements $V = \mathbb{Z}_{6k} \times \{1, 2\} \cup \{\infty\}$. Each base cycle below is to be developed modulo (6k, -).

$$\begin{split} \textbf{I.1.} \ \ k \ \text{is odd}, \ k \geq 1 \\ & \text{i)} \ \ (0_1, k_1, (2k)_1, (3k)_1, (4k)_1, (5k)_1) & (\text{orbit of length } k) \\ & \text{ii)} \ \ (0_1, 0_2, (3k-1)_2, (6k-1)_2, (3k)_2, (3k)_1) & (\text{orbit of length } 3k) \\ & \text{iii)} \ \ (0_1, (2k)_2, 1_1, (3k)_1, (5k)_2, (3k+1)_1) & (\text{orbit of length } 3k) \\ & \text{iv)} \ \ (\infty, 0_2, k_2, (k+1)_1, (k-2)_2, k_1) & \\ & \text{v)} \ \ (0_2, (4i+2)_1, (5i+2)_1, (i+2)_2, (5i+3)_1, i_2), & \\ & i=1,2,\ldots, k-1 & \\ & \text{vi)} \ \ (0_2, (4k+4i)_1, (5k+8i-3)_1, (4k+4i-1)_1, 1_2, (k+4i-2)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (5k+8i)_1, (4k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (4k+4i)_1, (2k+4i)_1, 1_2, (k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (4k+4i)_1, (4k+4i)_1, (4k+4i)_1, (4k+4i)_2), & \\ & i=1,2,\ldots, (k-1)/2 & \\ & \text{vii)} \ \ (0_2, (4k+4i+1)_1, (4k+4i)_1, ($$

viii)
$$(0_1, 2_2, (3k-1)_2, 1_2, 1_1, (3k-2)_1)$$

II. Let $n \equiv 9 \pmod{12}$, n = 12k + 9. The set of elements $V = \mathbb{Z}_{6k+4} \times \{1,2\} \cup \{\infty\}$. Each base block cycle is to be developed modulo (6k + 4, -).

II.1. k is even, $k \ge 0$.

- i) $(0_1, 0_2, 1_2, (3k+3)_2, (3k+2)_2, (3k+2)_1)$ (orbit of length 3k+2))
- ii) $(\infty, 0_2, 3_1, 1_2, 2_1, 1_1)$
- iii) $(0_2, (4i+2)_1, (5i+3)_1, (i+3)_2, (5i+4)_1, (i+1)_2),$ $i = 1, 2, \dots, k$

iv)
$$(0_2, (4k+4i+2)_1, (5k+8i)_1, (4k+4i+1)_1, 1_2, (k+4i-1)_2),$$

 $i = 1, 2, \dots, k/2$

v) $(0_2, (4k+4i+3)_1, (5k+8i+3)_1, (4k+4i+2)_1, 1_2, (k+4i+1)_2), i = 1, 2, \dots, k/2$

II.2 k is odd, $k \ge 1$.

- i) $(0_2, 1_1, (3k+3)_1, (3k+2)_2, (3k+3)_2, 1_2)$ (orbit of length 3k+2)
- ii) $(\infty, 0_2, 5_1, 1_2, 4_1, 3_1)$
- iii) $(0_2, (4i+4)_1, (5i+5)_1, (i+3)_2, (5i+6)_1, (i+1)_2),$ $i = 1, 2, \dots, k$
- iv) $(0_2, 2_1, (k+4)_1, 1_1, 1_2, (k+3)_2)$
- v) $(0_2, (4k+4i+4)_1, (5k+8i+4)_1, (4k+4i+3)_1, 1_2, (k+4i+1)_2), i = 1, 2, \dots, (k-1)/2$
- vi) $(0_2, (4k+4i+5)_1, (5k+8i+7)_1, (4k+4i+4)_1, 1_2, (k+4i+3)_2), i = 1, 2, \dots, (k-1)/2$

Corollary 1.2. A 4-rotational 6CS(n) exists if and only if $n \equiv 1$ or 9 (mod 12).

Proof. Let α be an automorphism of a 2-rotational 6CS(n) such that it consists of one fixed point and two cycles of length $l = \frac{n-1}{2}$. Since l is even, α^2 is an automorphism that contains one fixed point and four cycles of length $\frac{n-1}{4}$.

By analogy with Steiner triple systems, let us call a 6-cycle system *reverse* if it admits as an automorphism an involution with exactly one fixed point.

Corollary 1.3. A reverse 6CS(n) exists if and only if $n \equiv 1 \text{ or } 9 \pmod{12}$.

Proof. If α is an automorphism of a 2-rotational 6CS(n) that contains one fixed point and two cycles of length $\frac{n-1}{2}$, then $\alpha^{\frac{n-1}{4}}$ is a required involution.

2 Some enumeration results

The 6-cycle systems appear to be very numerous. But the only enumeration result on 6CS(n) that we are aware of is in [2] where it is established that there are exactly 640 nonisomorphic 6CS(9). We have enumerated *cyclic* 6CS(n) for n = 13 and n = 21. They number 16, and 378, respectively. In Tables 1 and 2, we list the base cycle of all 16 cyclic 6CS(13) and the three base cycles of the 10 lexicographically smallest 6CS(21); the remaining cyclic 6CS(21) can be found in

http://home.agh.edu.pl/~meszka/2r6cs_13.html

We have also enumerated the 2-rotational 6CS(13); there are 384 of them. In Table 3 we list the three base cycles of the 10 lexicographically smallest 2-rotational 6CS(13); the remaining such systems can be found in

http://home.agh.edu.pl/~meszka/2r6cs_13.html

Table 1 Cyclic 6-cycle systems of order 13.

$V = \mathbb{Z}_{13}.$	
1. $(0, 1, 3, 6, 2, 7)$	9. $(0, 1, 3, 12, 4, 7)$
2. $(0, 1, 3, 6, 2, 8)$	10. $(0, 1, 3, 12, 4, 10)$
3. $(0, 1, 3, 6, 11, 7)$	11. $(0, 1, 3, 12, 5, 10)$
4. $(0, 1, 3, 6, 11, 4)$	12. $(0, 1, 3, 9, 5, 8)$
5. $(0, 1, 3, 6, 12, 8)$	13. $(0, 1, 4, 6, 2, 7)$
6. $(0, 1, 3, 6, 12, 4)$	14. $(0, 1, 4, 6, 2, 8)$
7. $(0, 1, 3, 12, 2, 7)$	15. $(0, 1, 4, 9, 11, 7)$
8. $(0, 1, 3, 12, 2, 8)$	16. $(0, 1, 6, 9, 11, 7)$

The full automorphism group of each of the above systems has order 13, except for systems No. 5, 9, and 16 whose group has order 39.

Table 2 Cyclic 6-cycle systems of order 21 (the first ten out of 378).

 $V = \mathbb{Z}_{21}.$

1. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 1, 10)2. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 1, 12)3. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 2, 10)4. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 2, 13)5. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 4, 12)6. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 4, 12)6. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 14, 4, 13)7. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 15, 1, 10)8. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 15, 1, 12)9. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 15, 5, 12)10. (0, 1, 7, 8, 14, 15), (0, 2, 7, 9, 14, 16), (0, 3, 7, 15, 5, 14)

Each of the 378 cyclic 6CS(21) has \mathbb{Z}_{21} as its full automorphism group.

Table 3 2-rotational 6-cycle systems of order 13.

$$\begin{split} V &= \mathbb{Z}_6 \times \{1,2\} \cup \{\infty\}. \\ 1. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,2_1,4_2,0_2) \\ 2. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,2_1,4_2,2_2) \\ 3. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,5_1,4_2,0_2) \\ 4. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,5_1,4_2,2_2) \\ 5. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,3_2,1_1,0_2) \\ 6. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,3_2,4_1,0_2) \\ 7. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,1_2,5_2,3_1,2_2) \\ 8. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,2_2,1_1,0_2,4_2) \\ 9. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,2_2,3_1,4_2,0_2) \\ 10. & (0_1,2_1,5_1,3_1,0_2,3_2), (0_1,0_2,1_2,3_1,3_2,4_2), (\infty,0_1,2_2,3_1,4_2,0_2) \\ \end{split}$$

Each of the 384 nonisomorphic 2-rotational 6CS(13) has \mathbb{Z}_6 as its full automorphism group.
